Twisted Wrench specializing in the service of:

JUNE 2015

AC weather is coming!

In Vermont the transition from needing heat to wanting air conditioning in our vehicles happens rather quickly. This can feel like there is limited time to prepare car's AC to be ready for you. AC in a vehicle can work fine for years, then inevitably it's "not working" usually due to systems refrigerant slowly leaking over time. New cars are less likely to lose its charge of refrigerant but not everyone has a new vehicle. In older vehicles it is possible to check the refrigerant pressures to see if it's changed before the AC surprises you by automatically shutting off. AC systems are designed to shut down when pressures go down.

For the latest news & updates from Team Twisted Wrench

To insure the AC will continue to cool your car down we recommend getting it checked – even if it appears to be working OK. Don't get surprised with sneaky low pressure turning your AC off unannounced!

Just a friendly reminder from the Twisted Wrench team.

Air Conditioning System
